

KOHLER SYNERGY

An adaptive enterprise AI layer for knowledge, actions, memory and governed workflows.

FROM CHATBOT TO AGENT

Understand → **Retrieve** → **Act** → **Verify**

Customer support

Grounded troubleshooting, warranty answers and support-ticket actions.

Enterprise workflows

A common agent layer over tools, connectors, memory and approval policies.

Prototype demonstrates
Knowledge retrieval
Warranty intelligence
Tool-based actions
Human approval
Persistent conversations
Audit activity

Governed automation

Low-risk actions can execute; high-risk actions pause for human approval.

One orchestration layer, shared capabilities

The model provider can change without redesigning the business-action layer.

MODEL-INDEPENDENT BUSINESS LOGIC

Same tools → same policy → same connectors → same audit trail

Designed for enterprise behavior, not scripted replies

The prototype combines adaptive responses with deterministic controls.

Self-updating knowledge

Document → AI category suggestion
→ approval → versioning → semantic index.

Human-in-the-loop

Risk policy separates read-only, low-risk and high-risk actions.

Selective orchestration

Manager/worker delegation is reserved for complex cross-domain work.

Memory

Persistent chat + selective episodic memory.

Evidence-aware answers

Knowledge retrieval and tool results become evidence for response generation.

Adaptive UX

Response structure changes with the request instead of forcing one template.

Provider resilience

Gemini primary with an OpenRouter fallback layer in the prototype.

Auditability

Observable Agent Activity captures actions and results without exposing private reasoning.

KEY PRINCIPLE

AI decides what is useful; deterministic software decides what is allowed.

From customer support to a broader enterprise AI layer

The same foundation can expand across workflows once production connectors are attached.

Prototype boundary Synthetic enterprise data and mock connectors are used for the working prototype; production adapters can replace them without changing the core agent policy/tool architecture.
